EN842100, 2567/2 - Homework #2

Problem 1

(a) Construct a 2D transformation matrix (using homogeneous coordinates) that rotates an object 90 degree clockwise around the origin

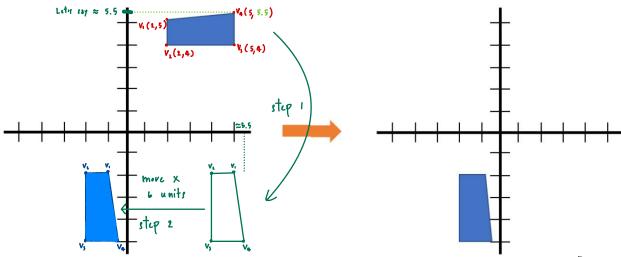

$$\begin{bmatrix} cos(\theta) & -sin(\theta) & 0 \\ sin(\theta) & cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix} \xrightarrow{\text{rotates} = 90} \begin{bmatrix} cos(-90) & -sin(-90) & 0 \\ sin(-90) & cos(-90) & 0 \\ 0 & 0 & 1 \end{bmatrix} \longrightarrow \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\begin{array}{c} \bullet \\ \begin{bmatrix} \lambda \\ 1 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}, \begin{bmatrix} \lambda \\ \lambda \\ 1 \end{bmatrix} = \begin{bmatrix} \lambda \\ -\lambda \\ 1 \end{bmatrix}$$

(b) In 2D, write the sequence of matrix transformations that would need to be multiplied in order to achieve a rotation around the point (10, -20)

1 # To origin translate the point (10, -20) to the origin (0,0)
$$\begin{bmatrix} 1 & 0 & -10 \\ 0 & 1 & 20 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \end{bmatrix}$$
2 # R rotate around the origin using the rotation matrix.
$$\begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix}$$
3 # Took translate the point back to its original position
$$\begin{bmatrix} 1 & 0 & 10 \\ 0 & 1 & -20 \\ 0 & 0 & 1 \end{bmatrix}$$
• Final transformation matrix = Took × R × Too origin

(c) Construct a 2D transformation matrix (using homogeneous coordinates) that transform the object as shown below

step 2 move the object 6 units to the left (move x 6 units), matrix to move x 6 units

$$M = \begin{bmatrix}
1 & 0 & -6 \\
0 & 1 & 0
\end{bmatrix}$$

$$\begin{bmatrix}
0 & 1 & 0 \\
-1 & 0 & 0
\end{bmatrix} = \begin{bmatrix}
0 & 1 & -6 \\
-1 & 0 & 0
\end{bmatrix}$$

$$\begin{bmatrix}
0 & 1 & 0 \\
-1 & 0 & 0
\end{bmatrix}$$

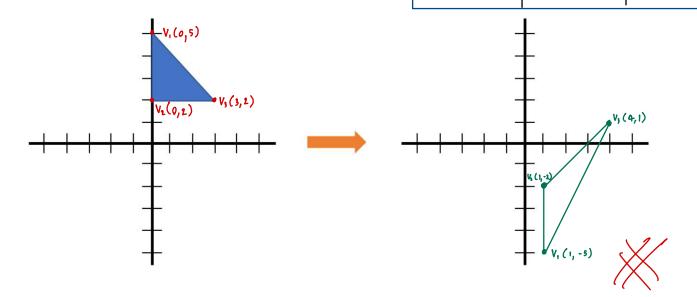

(d) Given a 2D transformation matrix (using homogeneous coordinates) and the original image as shown below, draw the transformed image in the plot on the right.

$$\begin{bmatrix} 1 & 0 & 1 \\ 1 & -1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} \checkmark & +1 \\ \checkmark & -Y \end{bmatrix} = \begin{bmatrix} \checkmark & +1 \\ \checkmark & -Y \end{bmatrix} \begin{bmatrix} v_1(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_2(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_3(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_4(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_5(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_6(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_7(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_1 s) = \begin{bmatrix} 0+1 \\ o_1 s \end{bmatrix} \\ v_8(o_$$

$$V_{1}(0,5) = \begin{bmatrix} 0+1 \\ 0-5 \\ 0-5 \end{bmatrix} \qquad V_{2}(0,2) = \begin{bmatrix} 0+1 \\ 0-1 \\ 0-1 \end{bmatrix} \qquad V_{3}(3,2) = \begin{bmatrix} 3+1 \\ 3-1 \\ 3-1 \end{bmatrix}$$

$$= \begin{bmatrix} -1 \\ -1 \end{bmatrix} \qquad = \begin{bmatrix} -1 \\ 1 \end{bmatrix} \qquad V_{3}(4,1)$$

$$V_{1}(1,-5) \qquad V_{2}(1,-2) \qquad V_{3}(4,1)$$

Problem 2

(a) What are homogeneous coordinates? Why is the main reason it is used in Computer

Homogeneous coordinates add an extra dimension to Euclidean coordinates, enabling transformations like translation, scaling, rotation and perspective projection to be performed using matrix multiplication. It makes combining transformations easier and faster.

(b) What is the equivalent Euclidean coordinate of the following homogeneous coordinate?

$$\begin{bmatrix} -4 \\ 1 \\ 8 \\ -2 \end{bmatrix} \longrightarrow \begin{bmatrix} \frac{-4}{2} \\ \frac{1}{2} \\ \frac{8}{2} \end{bmatrix} \longrightarrow \begin{bmatrix} 2 \\ -0.5 \\ -4 \end{bmatrix}$$

.. the equivalent Euclidean coordinates are (2, -0.9, -4)

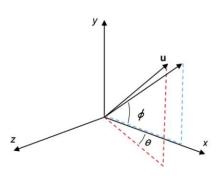

(c) Given a 3D transformation matrix (using homogeneous coordinates) that reflects objects through the plane y = 0 below, show that this is equivalent to multiplying a rotation matrix around the z-axis (what is the angle?) and a reflection matrix through the plane x = (what is the order of multiplication?)

• Order of multiplication: Reflection comes first, followed by Rotation.

(d) In 3D, we discussed in class that we can rotate an object around arbitrary axis \mathbf{u} by β degree counter-clockwise as follows: (1) rotating the axis u to align with x-axis. (2) rotating around **u** (which is now x-axis) by β degree, and (3) rotating the axis **u** back to its original

The final formula is

$$R_{u}(\boldsymbol{\beta}) = R_{y}(-\theta)R_{z}(\boldsymbol{\phi})R_{x}(\boldsymbol{\beta})R_{z}(-\boldsymbol{\phi})R_{y}(\theta)$$

Alternatively, it is possible that we align axis u with y-axis (instead of x-axis) to perform the rotation. What would be the final formula if we do that?

$$R_{\mathbf{u}}(\mathbf{\beta}) = R_{\mathbf{x}}(-\mathbf{\theta}) R_{\mathbf{z}}(-\mathbf{\phi}) R_{\mathbf{y}}(\mathbf{\beta}) R_{\mathbf{z}}(\mathbf{\phi}) R_{\mathbf{x}}(\mathbf{\theta})$$

Problem 3

- (a) Explain what each of the following transformations is used for in Computer Graphics, and what is the order that they are applied.
 - Perspective Projection Transformation
 Adds the depth by making distant object appear smaller
 - 2. Model Transformation

 Moves, rotates, or scales object in the scene.
 - 3. Orthographic Projection Transformation

 Projects 3D objects onto 2D screen without depth effect.
 - 4. Viewport Transformation

 Maps the final 2D image to the screen or window.
 - 5. View Transformation

 Moves the camera to define what is seen in the scene

Order: Model transformation -> View transformation -> Perspective Projection transformation .

Viewport transformation -- Orthographic Projection transformation --

(b) Explain what the vectors **eye**, **n**, **u**, **v** vectors are, and how they are used in view transformation.

eye: The position of camera in the 3D world

n: A vector pointing in the direction the camera looks

u : A vector pointing to the right side of the comera

V : A vector pointing upward from the camera

How they'r used in view transformation:

These vectors define the camera's position and orientation, It helps to convert world coordinates into the camera's view for rendering the scene.
